

The chapter contains **1.1 Diversity in the Living World** and **1.2 Taxonomic Categories**, including nomenclature, taxonomy, systematics, hierarchy, Table 1.1, summary and exercises.

CLASS 11 BIOLOGY — CHAPTER 1

THE LIVING WORLD

NCERT + NEET Master Notes

CHAPTER MASTER FLOWCHART

1. DIVERSITY IN THE LIVING WORLD

1.1 What is the Living World?

The living world contains an **amazing diversity of organisms**.

Organisms occur in extremely different habitats:

Living organisms
↓
Cold mountains
↓
Deciduous forests
↓
Oceans
↓
Freshwater lakes
↓
Deserts
↓
Hot springs

NCERT also uses examples such as:

- Galloping horse 🐎
- Migrating birds 🐦
- Valley of flowers 🌸
- Attacking shark 🦈

These examples show the **wide variety of living forms and habitats**.

? What is life?

NCERT separates this into two questions:

1. Technical question:

➡ What is living as opposed to non-living?

2. Philosophical question:

➡ What is the purpose of life?

✦ **NCERT focus:** Biology deals with the **technical question** — “what is living?”, not the philosophical purpose of life.

🔥 **NEET Priority:** 🟡 **Moderate**

🧠 **Quick Memory**

Biology → What is living?

Philosophy → What is the purpose of life?

2. 🧬 **DIVERSITY IN THE LIVING WORLD**

If we look around ourselves, we find:

- Plants 🌱
- Insects 🐛
- Birds 🐦
- Pets 🐕
- Other animals
- Microscopic organisms that cannot be seen with naked eyes

The wider the area we explore, the greater the **number and variety of organisms** we encounter.

For example:

Small area

↓

Fewer organisms observed

Larger area

↓

Greater variety

Dense forest

↓

Very large number + variety

NCERT states that each different kind of plant, animal or organism represents a **species**.

📌 **NCERT DATA**

1.7–1.8 million

The number of **known and described species** is approximately:

★ 1.7–1.8 million

This refers to the biodiversity or number/types of organisms present on Earth.

⚠ New organisms continue to be identified as new areas are explored, including previously explored areas.

🔥 **NEET Priority:** ● **Very High**

🧠 **Remember:**

Known + described species → 1.7–1.8 million

3. 🏷️ **WHY DO WE NEED SCIENTIFIC NAMES?**

Different regions often use **different local names** for the same organism.

Same organism
↓
Different places
↓
Different local names
↓
Confusion
↓
Need for one standard name
↓
Scientific nomenclature

NCERT explains that scientific naming ensures that an organism can be referred to by the **same name throughout the world**.

4. 🔍 **IDENTIFICATION**

Definition

Identification = determining **what organism a particular name is attached to** after correctly describing the organism.

Flow:

Organism

↓
Correct description
↓
Determine its identity
↓
Identification

✦ **Important distinction:**

Term	Meaning
Identification	Determining/recognising the organism
Nomenclature	Giving a standard name
Classification	Grouping organisms into categories

🔥 **NEET favourite distinction**

5. 🏷️ NOMENCLATURE

Definition

Nomenclature = the process of **standardising the naming of living organisms** so that an organism is known by the same name worldwide.

🌿 International Naming Codes

Plants

➡ **ICBN**

International Code for Botanical Nomenclature

Animals

➡ **ICZN**

International Code of Zoological Nomenclature

Scientific naming

- Plants → ICBN
- Animals → ICZN

🔥 **NEET Priority:** ● **Very High**

Memory Trick

B = Botanical → ICBN

Z = Zoological → ICZN

6. BINOMIAL NOMENCLATURE

★ Extremely Important

Scientific names consist of **two components**.

The system was given by **Carolus Linnaeus** and is followed by biologists worldwide.

Example: Mango

Scientific name:

Mangifera indica

Part	Meaning
Mangifera	Genus / Generic name
indica	Specific epithet

Trap:

The second word is **specific epithet**, not technically the complete species name.

7. RULES OF BINOMIAL NOMENCLATURE

Rule  — Latin

Biological names are generally:

- Written in **Latin**
- **Latinised or derived from Latin**
- Written in **italics** when printed

✚ Their original language does not matter; the biological name is Latinised/derived from Latin.

Rule 2 — Two Components

Scientific name

↓
Generic name + Specific epithet

Example:

Mangifera + indica

Rule 3 — Italics / Underlining

Printed:

Mangifera indica

Handwritten:

Each word is **separately underlined**.

Mangifera indica

⚠ **Trap:**

When handwritten, don't underline the complete two-word name with one continuous line.

Rule 4 — Capitalisation

Generic name:

➡ **First letter CAPITAL**

Specific epithet:

➡ Small/lowercase

Correct:

Mangifera indica ✓

Incorrect:

Mangifera Indica ✗

Rule 5 — Author's Name

The author's name may appear after the specific epithet in **abbreviated form**.

Example:

Mangifera indica Linn.

Linn. = Linnaeus

It indicates that the species was first described by **Linnaeus**.

BINOMIAL NOMENCLATURE — NEET TRAP BOX

Statement	Correct?
Biological names are generally Latin	✓
First word = genus	✓
Second component = specific epithet	✓
Genus starts with capital letter	✓
Specific epithet starts with small letter	✓
Printed names are italicised	✓
Handwritten words are separately underlined	✓
Linnaeus gave the naming system	✓
Both words start with capital letters	✗

🔥 NEET Priority: ● Very High

8. CLASSIFICATION

It is practically impossible to study every living organism individually.

Therefore, organisms are grouped into convenient categories.

Definition

Classification = the process by which anything is grouped into convenient categories based on **easily observable characters**.

Examples of categories:

- Dogs
- Cats
- Mammals
- Wheat
- Rice
- Plants
- Animals

These categories help us organise organisms for study.

9. TAXA

Taxon

A **taxon** is a category/group used in classification.

Examples:

```
Animals
  ↓
Mammals
  ↓
Dogs
```

All three are **taxa**, but at different levels.

📌 **Taxon = unit/category of classification**

📌 **Plural = Taxa**

🔥 NEET Priority: ● Very High

10. TAXONOMY

Definition

Taxonomy is the process/study involving classification of organisms into different taxa.

Modern taxonomic studies use:

- External structure
- Internal structure
- Cell structure
- Development process
- Ecological information

These form the basis of modern taxonomic studies.

★ Four Basic Processes of Taxonomy

Remember:

$C \rightarrow I \rightarrow C \rightarrow N$

Characterisation → Identification → Classification → Nomenclature

🔥 NEET Priority: ● Very High

11. EARLY CLASSIFICATION

Taxonomy is not a new field.

Early humans mainly needed:

- Food 🍎
- Clothing 🧥
- Shelter 🏠

Therefore, the earliest classifications were based mainly on the **uses of organisms**.

🧠 **Memory:**

Early classification → USE

12. 🔗 SYSTEMATICS

Humans were interested not only in identifying organisms but also in understanding their **relationships**.

This led to:

SYSTEMATICS

The word comes from the Latin word:

systema

meaning **systematic arrangement of organisms**.

Linnaeus used:

Systema Naturae

as the title of his publication.

Later, the scope of systematics included:

- Identification
- Nomenclature
- Classification
- **Evolutionary relationships**

TAXONOMY vs SYSTEMATICS

Taxonomy	Systematics
Characterisation	Includes broader relationships
Identification	Identification
Classification	Nomenclature
Nomenclature	Classification
—	Evolutionary relationships

⚠ **Trap:**

Systematics takes **evolutionary relationships** into account.

🔥 **NEET Priority:** ● **High**

NCERT SCIENTIST BOX — ERNST MAYR

Ernst Mayr (1904–2004)

NCERT highlights Ernst Mayr as:

- Harvard evolutionary biologist
- Called “**The Darwin of the 20th century**”
- Worked in:
 - Ornithology
 - Taxonomy
 - Zoogeography
 - Evolution
 - Systematics
 - History and philosophy of biology
- Helped make **origin of species diversity** a central question in evolutionary biology.
- Pioneered the currently accepted definition of a **biological species**.
- Received:
 - Balzan Prize — 1983
 - International Prize for Biology — 1994
 - Crafoord Prize — 1999
- Died in **2004** at age 100.

📌 **NCERT Extra Fact:**

This scientist box appears in the provided NCERT chapter and should not be skipped.

13. **TAXONOMIC CATEGORIES**

Classification is **not a single-step process**.

Instead:

```
Classification
  ↓
Hierarchy of steps
  ↓
Each step = Rank / Category
  ↓
All categories together
  ↓
Taxonomic hierarchy
```

Each category is a **unit of classification** and is commonly called a **taxon**.

TAXONOMIC HIERARCHY

MOST IMPORTANT FLOWCHART

Ascending order:

```
SPECIES
  ↑
GENUS
  ↑
FAMILY
  ↑
ORDER
  ↑
CLASS
  ↑
PHYLUM / DIVISION
  ↑
KINGDOM
```

Or from highest → lowest:

```
KINGDOM
  ↓
PHYLUM / DIVISION
  ↓
CLASS
  ↓
ORDER
  ↓
FAMILY
  ↓
GENUS
  ↓
SPECIES
```

🔥🔥 NEET Priority: 🔴 VERY HIGH

14. 🦋 INSECTS — EXAMPLE OF TAXONOMIC CATEGORY

NCERT uses insects as an example.

Insects have common features such as:

Three pairs of jointed legs

Because they form a recognisable group, they can be classified and given a rank/category.

15. 🧬 SPECIES

★ Lowest Taxonomic Category

Species is the **lowest category** in the hierarchy described in the chapter.

Taxonomic studies consider a group of individual organisms having **fundamental similarities** as a species.

Closely related species can be distinguished using **distinct morphological differences**.

NCERT examples:

- *Mangifera indica*
 - *Solanum tuberosum*
 - *Panthera leo*
 - *Homo sapiens*
-

🔍 Understanding the Name

Mangifera indica

- **Mangifera** → genus
- **indica** → specific epithet

Solanum tuberosum

- **Solanum** → genus
- **tuberosum** → specific epithet

Panthera leo

- **Panthera** → genus
- **leo** → specific epithet

Homo sapiens

- **Homo** → genus
 - **sapiens** → specific epithet
-

16. GENUS

Definition

Genus comprises a group of **related species** having more characters in common compared with species of other genera.

In simple words:

Genus = group of closely related species

NCERT examples:

Solanum

- Potato
- Brinjal

Different species → same genus.

Panthera

- Lion — *Panthera leo*
- Leopard — *Panthera pardus*
- Tiger — *Panthera tigris*

Memory

Species → Genus = closely related species grouped together

17. FAMILY

Definition

Family = group of related genera.

Compared with genus/species, members of a family have **fewer similarities**.

Plants:

Solanaceae

includes:

- Solanum
- Petunia
- Datura

Family classification in plants considers both:

- Vegetative features
- Reproductive features

Animals:

Felidae

includes:

- Panthera
- Felis

Cat and dog belong to different families:

- Cat → **Felidae**
- Dog → **Canidae**

18. ORDER

Definition

Order = assemblage of families having some similar characters.

At higher levels, classification is based on **aggregates of characters**.

Plant example:

Convolvulaceae + Solanaceae

Order Polymoniales

mainly based on floral characters.

Animal example:

Felidae + Canidae

Order Carnivora

19. CLASS

Definition

Class = group/category containing related orders.

NCERT example:

```
Order Primata
+
Order Carnivora
↓
Class Mammalia
```

Primata includes monkey, gorilla and gibbon.

Carnivora includes animals such as tiger, cat and dog.

Both are placed in **Mammalia**.

20. PHYLUM / DIVISION

Animals → Phylum

Classes of animals such as:

- Fishes
- Amphibians
- Reptiles
- Birds
- Mammals

are grouped into:

Phylum Chordata

based on common features such as:

- Notochord
- Dorsal hollow neural system

Plants → Division

In plants, the corresponding higher category is called:

Division

📌 **NEET Trap**

Animals → Phylum
Plants → Division

🔥 **Very High Priority**

21. 👑 KINGDOM

Animals

All animals belonging to various phyla:

➡ **Kingdom Animalia**

Plants

Plants belonging to various divisions:

➡ **Kingdom Plantae**

SPECIES → KINGDOM: WHAT CHANGES?

As we move upward:

Species
↓
Genus
↓
Family
↓
Order
↓
Class
↓
Phylum/Division
↓
Kingdom

Common characteristics:

DECREASE ↓

Difficulty in determining relationships:

INCREASE ↑

Complexity of classification:

INCREASE ↑

NCERT explicitly states that lower taxa share more characteristics, while higher categories have fewer common characteristics and are more difficult to relate precisely.

GOLDEN NEET RULE

Lower the taxon → More common characteristics

Higher the taxon → Fewer common characteristics

Species
★ ★ ★ ★ ★ ★ ★ ★
Genus
★ ★ ★ ★ ★ ★ ★ ★

Family

Order

Class

Kingdom

Memory:

Going UP → Similarity goes DOWN

NCERT TABLE 1.1 — MUST LEARN

Common name	Biological name	Genus	Family	Order	Class	Phylum/Division
Man	<i>Homo sapiens</i>	Homo	Hominidae	Primata	Mammalia	Chordata
Housefly	<i>Musca domestica</i>	Musca	Muscidae	Diptera	Insecta	Arthropoda
Mango	<i>Mangifera indica</i>	Mangifera	Anacardiaceae	Sapindales	Dicotyledonae	Angiospermae
Wheat	<i>Triticum aestivum</i>	Triticum	Poaceae	Poales	Monocotyledonae	Angiospermae

NEET Priority: Very High

This table is particularly useful for **match-the-following** and **hierarchy** questions.

TAXONOMIC HIERARCHY MEMORY TRICK

Highest → Lowest

K P C O F G S

King Philip Came Over For Good Soup

Letter Category

K Kingdom

P Phylum

Letter Category

C	Class
O	Order
F	Family
G	Genus
S	Species

For plants:

Kingdom → Division → Class → Order → Family → Genus → Species

CONFUSION BUSTER

1. Genus vs Specific epithet

Mangifera indica

- Mangifera = **Genus**
 - indica = **Specific epithet**
-

2. Species vs Specific epithet

Species = taxonomic category.

Specific epithet = second component of a binomial name.

3. Taxon vs Taxonomy

Taxon = a category/unit.

Taxonomy = processes dealing with characterisation, identification, classification and nomenclature.

4. Taxonomy vs Systematics

Taxonomy → identification, naming and classification.

Systematics → broader study that also considers **evolutionary relationships**.

5. Phylum vs Division

Animals → Phylum

Plants → Division

VERIFIED NEET/AIPMT PYQ CONNECTIONS

I'm keeping these separate from newly created practice questions. The following PYQ records are independently listed by SATHEE/NEETprep sources. ([Sathee](#))

PYQ 1 — NEET 2023

Topic: Taxonomic categories

Question tested which family the **housefly** belongs to.

Answer:

Muscidae

NCERT connection:

Housefly → *Musca domestica* → Musca → **Muscidae**

([NeetPrep](#))

 **What to learn:** NCERT Table 1.1

PYQ 2 — NEET 2023

Topic: Binomial nomenclature

The question tested:

- Generic name
- Specific epithet
- Person associated with the system

Correct combination:

Generic name + Specific epithet + Carolus Linnaeus

([NeetPrep](#))

 **What to learn:** Rules of binomial nomenclature.

PYQ 3 — NEET 2022

Topic: Taxonomic hierarchy

Question tested the correct **ascending hierarchy**.

Correct:

Kingdom → Phylum → Class → Order → Family → Genus → Species

([NeetPrep](#))

 **NEET Favourite**

PYQ 4 — NEET 2021

Topic: Family

Question asked which organism belongs to **Muscidae**.

Answer:

Housefly

([NeetPrep](#))

PYQ 5 — Previous NEET/AIPMT question

SATHEE's chapter-wise PYQ compilation includes questions testing correct scientific naming and taxonomic identification, including identification of correctly named organisms.

([Sathee](#))

Concept tested:

Correct binomial format + organism identification.

COMPLETE NCERT SUMMARY

Living World

Huge diversity of organisms

Need organised study

Identification

Nomenclature

Classification

Taxonomy

Taxonomic categories

Species → Genus → Family → Order

→ Class → Phylum/Division → Kingdom

Core points:

- Living organisms show enormous diversity.
- About **1.7–1.8 million species** are known and described.
- Different local names create confusion.

- **Nomenclature** provides standard scientific names.
 - **Identification** determines the organism.
 - Plants follow **ICBN** and animals follow **ICZN** according to the chapter.
 - **Binomial nomenclature** has two components.
 - **Carolus Linnaeus** is associated with the naming system.
 - First component = **generic name**.
 - Second component = **specific epithet**.
 - Genus starts with a capital letter.
 - Specific epithet starts with a small letter.
 - Biological names are generally Latin/Latinised and italicised.
 - **Taxonomy** involves characterisation, identification, classification and nomenclature.
 - **Systematics** also considers evolutionary relationships.
 - **Species** is the lowest taxonomic category.
 - Genus contains related species.
 - Family contains related genera.
 - Order contains related families.
 - Class contains related orders.
 - Phylum/Division contains related classes.
 - Kingdom is the highest category discussed here.
 - Going from species → kingdom, common characteristics decrease.
-

TOP 20 NEET TARGETS

Must Know

1. **1.7–1.8 million** known and described species
2. Definition of **nomenclature**
3. Definition of **identification**
4. Definition of **classification**
5. **ICBN** → **plants**
6. **ICZN** → **animals**
7. **Binomial nomenclature**
8. **Generic name + specific epithet**
9. **Carolus Linnaeus**
10. *Mangifera indica*
11. Genus capitalised
12. Specific epithet lowercase
13. Printed → italics
14. Handwritten → separately underlined
15. Author abbreviation after specific epithet
16. **Taxon / taxa**
17. **Taxonomy = C + I + C + N**
18. **Systematics includes evolutionary relationships**
19. **Species** → **Genus** → **Family** → **Order** → **Class** → **Phylum/Division** → **Kingdom**
20. Going upward → **common characteristics decrease**

ULTRA-FAST REVISION SHEET

Diversity

Known species → 1.7–1.8 million

Naming

Nomenclature → standardised naming

Identification

Identification → recognising/determining organism

Codes

Plants → ICBN

Animals → ICZN

Binomial

Genus + Specific epithet

Linnaeus

Writing

Genus → Capital

Specific epithet → lowercase

Printed → Italics

Handwritten → separately underlined

Taxonomy

Characterisation → Identification → Classification → Nomenclature

Systematics

Taxonomy + evolutionary relationships

Hierarchy

Kingdom → Phylum/Division → Class → Order → Family → Genus → Species

Going upward

Common characteristics ↓

Difficulty of relationship determination ↑

Complexity ↑

ACTIVE RECALL — TRY WITHOUT LOOKING

Questions

1. How many species are known and described according to NCERT?
2. Why are scientific names necessary?
3. Define nomenclature.
4. Define identification.
5. What are ICBN and ICZN?
6. What are the two components of binomial nomenclature?
7. Who gave the binomial naming system mentioned in NCERT?
8. What is the correct scientific name of mango?
9. Which component begins with a capital letter?
10. How are biological names written when printed?
11. How are they written when handwritten?
12. What does the abbreviation “Linn.” indicate in *Mangifera indica* Linn.?
13. Define classification.
14. What is a taxon?
15. What are the basic processes of taxonomy?
16. What is systematics?
17. What is the lowest taxonomic category?
18. What is a genus?
19. What is a family?
20. What is an order?
21. What is a class?
22. What is a phylum?
23. What is a division?
24. What is a kingdom?
25. What happens to common characteristics as we move from species to kingdom?
26. Give the taxonomic position of housefly.
27. Give the taxonomic position of mango.
28. Give the taxonomic position of wheat.

29. Give the taxonomic position of man.
 30. What evolutionary aspect is included in systematics?
-

ACTIVE RECALL ANSWERS

1. **1.7–1.8 million**
 2. To provide a standard name and avoid confusion from local names.
 3. Standardising the naming of organisms.
 4. Determining the organism to which a name is attached.
 5. **ICBN — plants; ICZN — animals**
 6. **Generic name + specific epithet**
 7. **Carolus Linnaeus**
 8. *Mangifera indica*
 9. **Generic name**
 10. **Italics**
 11. **Separately underlined**
 12. It indicates **Linnaeus**, who first described the species.
 13. Grouping organisms into convenient categories based on observable characters.
 14. A category/unit of classification.
 15. **Characterisation, identification, classification, nomenclature**
 16. Study including relationships among organisms and evolutionary relationships.
 17. **Species**
 18. Group of related/closely related species.
 19. Group of related genera.
 20. Assemblage of families.
 21. Category containing related orders.
 22. Higher category containing classes in animals.
 23. Corresponding higher category used for plants.
 24. Highest category discussed in the hierarchy.
 25. They **decrease**.
 26. *Musca domestica* → Musca → Muscidae → Diptera → Insecta → Arthropoda.
 27. *Mangifera indica* → Mangifera → Anacardiaceae → Sapindales → Dicotyledonae → Angiospermae.
 28. *Triticum aestivum* → Triticum → Poaceae → Poales → Monocotyledonae → Angiospermae.
 29. *Homo sapiens* → Homo → Hominidae → Primata → Mammalia → Chordata.
 30. **Evolutionary relationships.**
-

NCERT EXERCISES — ANSWERS

The PDF's exercises ask about the need for classification, changing classification systems, criteria for classifying people, identification, mango's correct scientific name, taxon,

hierarchy, meanings of species, definitions of phylum/class/family/order/genus, and illustration of hierarchy.

1. Why are living organisms classified?

Because there is a huge diversity of organisms, making individual study difficult. Classification groups organisms into convenient categories based on characteristics, making their study easier.

2. Why are classification systems changing?

As scientific knowledge increases and new information about organisms, their characteristics and relationships becomes available, classification systems can change.

3. What criteria could be used to classify people?

Possible observable criteria could include characteristics such as age group, occupation, physical features, habits, etc. The chosen criterion depends on the purpose of classification.

4. What do we learn from identification?

Identification tells us **which organism** we are dealing with and helps connect it with its correct scientific name.

5. Correct mango name

✓ *Mangifera indica*

✗ *Mangifera Indica*

The genus begins with a capital letter, while the specific epithet begins with a lowercase letter.

6. Define taxon with examples.

A **taxon** is a unit/category of classification.

Examples:

- Species
- Genus
- Family
- Order
- Class
- Phylum
- Kingdom

7. Correct sequence

Correct option:

(c) Species → Genus → Order → Phylum

Because the complete ascending sequence is:

Species → Genus → Family → Order → Class → Phylum/Division → Kingdom

8. Meanings of species

NCERT itself asks students to explore currently accepted meanings of **species** and discuss differences in higher plants/animals and bacteria. The important point for this chapter is that species is the **lowest taxonomic category** and taxonomic studies consider organisms with fundamental similarities as a species.

9. Define:

Phylum: Higher taxonomic category containing classes in animals.

Class: Category containing related orders.

Family: Category containing related genera.

Order: Assemblage of related families.

Genus: Group of related species.

10. Illustrate hierarchy

Kingdom

FINAL ONE-MINUTE CHAPTER MAP

THE LIVING WORLD

If you remember only 7 things before NEET:

1.7–1.8 million → ICBN/ICZN → Binomial nomenclature → Linnaeus → Generic name + specific epithet → Taxonomy = C-I-C-N → K-P-C-O-F-G-S.

The notes above are grounded in the uploaded NCERT chapter, including its exact chapter structure, terminology, examples, scientist box, hierarchy and Table 1.1.
